New Regulations Require Review of Emotional History Data and an Interview including Real-Time Emotional Monitoring for Gun Ownership

By DANNY HAKIM NOV. 24, 2017

A law signed today by President Johnson has required individuals applying for a gun ownership permit to submit no less than 5 years of their emotional history data to the federal government for review. This emotional history data is collected by chips implanted in every child born in the United States before they return home from the hospital, which are manufactured by the technology company EMOTIV. This data tracks prevalent emotions felt at any given time based on analysis of brain wave activity. This data is sent to the government for processing, and a minimal threshold of 'favorability' must be met for a gun ownership application to pass this initial test. After this first test, applicants will be interviewed by a emotions expert, who will be monitoring emotional changes in the applicant during the interview. The results of this test will be used as part of the decision process on whether or not the applicant is 'fit' to be a legal gun owner.
